

REMOVING WAX FROM YOUR MELTER

HOT METHODS

Hot Pour Method:

Pour your wax out while still liquid into a sturdy container (old coffee cups, canisters, old candle jars). Use a paper towel to wipe the bowl clean.

Cotton Ball Method:

Place a cotton ball or two into the melted wax to soak it up. Remove the cotton ball and wipe the bowl clean with a paper towel.

Water Method:

While the wax is still hot, add a few drops of water to the bowl. Allow the wax to harden. The wax should pop right out. Be careful as water might spatter when removing.

COLD METHODS:

Freezer Method:

Place your melter bowl into the freezer for 5-10 minutes. The wax should pop right out. It may need a little nudge with a butter knife.

Ice Cube Method:

Place 1-2 ice cubes in the bowl on top of the wax. Pour off after 5-10 minutes. The wax should slide out. It may need a little nudge with a butter knife.

Warm Water Method:

Run very warm water on the bottom of the wax melt bowl for several seconds. The wax should start warming up enough to slide the wax out.
